

WESTERN EXCELSIOR WEB SITE UPDATED INTRODUCING PP5-XTREME

Release Date: 7/11/10

Western Excelsior is proud to introduce the next generation of High Performance Turf Reinforcement Mat (HP-TRM). Western Excelsior has developed a new process for development of woven HP-TRM materials. This process yields the strongest, most durable, highest performing product available. The all new, patent pending process for manufacturing PP5-Xtreme is specifically designed to yield a product that provides greater strength at low elongation (strain). PP5-Xtreme was designed from the ground up to provide a material that not only provides industry leading strength and performance but is also optimized to promote the establishment of vegetation. This combination of optimized properties and performance positions PP5-Xtreme as the clear choice for maximum safety and reliability.

In addition to providing permanent turf reinforcement for channel lining projects, PP5-Xtreme was developed to provide durability when non-hydraulic loading or wheel loading is a concern. The greater strength of PP5-Xtreme at low elongation means the product does not shift or deform, even when heavily loaded. Finally, PP5-Xtreme includes the highest level of protection against UV degradation possible. Thus, PP5-Xtreme is ideal for deployment in any environment and provides unique advantages for arid and semi-arid environments.

PP5-Xtreme represents the new leader in turf reinforcement. An ideal choice to replace riprap and concrete with a cost-saving, green alternative that provides even greater performance and longevity. Learn about PP5-Xtreme here at westernexcelsior.com, on the dedicated product page.
